Musée national d'Histoire Naturelle Luxembourg

Gertsson C.A. – A checklist of the scale insects (Hemiptera Coccoidea) in Luxembourg.

A list of the scale insects recorded by the author in Luxembourg is reported. The list reports 34 species belonging to 25 genera in 7 families. Of these, 21 species are new records for the country. The recorded species show mainly Cosmopolitan and Palaearctic distribution. Most numerous families are the Coccidae, Diaspididae and Pseudococcidae.

KEY WORDS: Hemiptera, scale insects, checklist, Luxembourg.

INTRODUCTION

The scale insect fauna of Luxembourg has received scant attention. GARCIA *et al.*, (2016) records only six species; another four species are listed in SCHNEIDER & TANSON (2003); while only two species are recorded in CABI (1999) and DAISIE (2015).

RESULTS AND DISCUSSION

This list shows that currently, a total of 34 scale insect species are known in Luxembourg (Table 1). They belong to 26 genera and 7 families: Asterolecaniidae (1 species), Coccidae (11 species), Diaspididae (10 species), Eriococcidae (2 species), Margarodidae (1 species), Ortheziidae (3 species) and Pseudococcidae (6 species). A total of 21 species are new to the fauna of Luxembourg and their occurrence has not been previously published. Of these species 47 % have a Cosmopolitan distribution, while the next most prevalent species (38 %) have a Palearctic distribution.

Leucaspis fulchironiae (Boisduval) has been recorded only in Luxembourg. While LINDINGER (1935) treated this species as a junior synonym of *L. cockerelli* (now *Lopholeucaspis cockerelli* (Grandpré & Charmoy). Borchsenius (1966) treated it as an *incertae sedis* species. Unfortunately, the type material for the latter is presumed lost (GARCIA *et al.*, 2016).

Significantly, eight of the recorded species, namely *Coccus hesperidum*, *Pulvinaria floccifera*, *P. hydrangeae*, *P. regalis*, *Diaspis echinocacti*, *Kuwanaspis pseudoleucaspis*, *Planococcus citri* and *Pseudococcus longispinus* are alien invasive species in Europe. The records of *Eulecanium sericeum*, *Matsucoccus pini* and *Fonscolombia europaea*, so far recorded only in some European countries, add new data to their known distributional range.

This list should be considered as a starting point for future investigations. Given that around two hundred species of scale insects have been recorded in the fauna of neighbouring Germany (GARCIA; *et al.*; 2016, KÖHLER & KELY, 2011; KÖHLER & KOZÁR, 2009; SCHMUTTERER, 2000) it is safe to assume that many more new discoveries of scale insect species will be made in Luxembourg.

ACKNOWLEDGEMENTS

I would like to express sincere thanks to the Musée National d'Histoire Naturelle Luxembourg for funding this project. I am indebted in particular to Alain Frantz and Thierry Helminger Musée National d'Histoire Naturelle Luxembourg and Nico Schneider for providing me with information on collecting sites and literature.
